

Dutch Parliament — Energy Security Framing

Exploring when energy, climate, economics, and critical materials are framed as strategic security issues.

How to read this dashboard: a higher **Security Focus Score** means security-related language appears more often in a speech segment, adjusted for length. The key question is whether Dutch energy debates increasingly use words linked to threat, dependency, resilience, Russia, NATO, and strategic vulnerability.

Metadata note: Most party/affiliation values are still Unknown. Speaker-level analysis works, but party-level charts will become more useful after TEI party metadata is fully extracted.

Plain-English interpretation: Security language is appearing almost twice as often as before.

Key Finding: 16.8% of selected utterances combine energy and security language — with peak securitization in 2022. The most active energy-security speaker in this selection is **Mark Rutte**. Security focus surged after Russia's invasion of Ukraine (Feb 2022), driven by debates on gas dependency, LNG alternatives, and strategic autonomy.

2 · Framing intensity

Focus Scores per Year

Scores are adjusted for speech length. Higher values mean language is more concentrated in that framing.

Security vs Economic Framing

Dots represent utterances. Larger dots are more strongly on-topic.

3 · Securitization signal

Energy × Security Overlap

This shows the share of selected utterances that also contain security framing. A rising share suggests energy is increasingly treated as a strategic vulnerability.

AI-Powered Framing Report

Select any utterance from the search results above, paste its text here, and Claude will analyse its **framing strategy**, **security signals**, and **political context**. You can also summarise an entire debate by pasting multiple excerpts.

Analysis mode

- ☒ Summarise utterance ☐ Generate framing report
☐ Predict political orientation

Paste speech text to analyse

Paste one or more parliamentary utterances here...

Optional context (speaker, date, topic)

e.g. Mark Rutte, 2022-02-28, emergency energy debate

Analyse with Claude

How it works

Summarise utterance — extracts the core argument and identifies which framing dimensions (security / economic / climate / materials) dominate.

Framing report — produces a structured analytical memo in HCSS style, suitable for inclusion in a briefing.

Predict orientation — infers the likely party family based on language patterns, without using speaker metadata.

This dashboard is intended for exploratory discourse analysis. Keyword-based scores indicate framing patterns and should be interpreted alongside qualitative reading of the underlying utterances.
